- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   216 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =     93000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates ANNUAL Averages
```

```
 **This Run Includes:    216 Source(s);       1 Source Group(s); and    2338
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    215 VOLUME source(s)
                 and:      1 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   158.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.9 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   IPCP2_setup.err

 **File for Summary of Results:   IPCP2_setup.sum
```

 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   216 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =     93000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates ANNUAL Averages
```

```
 **This Run Includes:    216 Source(s);       1 Source Group(s); and    2338
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    215 VOLUME source(s)
                 and:      1 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   158.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.9 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   IPCP2_setup.err

 **File for Summary of Results:   IPCP2_setup.sum
```

Air Quality Statistics Report

Geographic Area: San Joaquin County, CA
Summary: by County
Year: 2022
Exceptional Events: Included (if any)
Statistics in red are above the level of the respective air quality standard

County	CO 1-hr 2nd Max	CO 8-hr 2nd Max	NO2 98th %ile	NO2 Ann. Mean	O3 1-hr 2nd Max	O3 8-hr 4th Max	SO2 99th %ile	SO2 24-hr 2nd Max	SO2 Ann. Mean	PM2.5 98th %ile	PM2.5 Wtd. Mean	PM10 24-hr 2nd Max	PM10 Annual Mean	Lead Max 3-mo Avg
San Joaquin County, CA	2.5	1.7	39	8	0.09	0.067	.	.	.	35	10.2	93	29	.

Get detailed information about this report, including column descriptions, at https://www.epa.gov/outdoor-air-quality-data/about-air-data-reports#con

AirData reports are produced from a direct query of the AQS Data Mart. The data represent the best and most recent information available to EPA from state agencies. However, some values may be absent due to incomplete reporting, and some values may change due to quality assurance activities. The AQS database is updated by state, local, and tribal organizations who own and submit the data.

Readers are cautioned not to rank order geographic areas based on AirData reports. Air pollution levels measured at a particular monitoring site are not necessarily representative of the air quality for an entire county or urban area.

This report is based on monitor-level summary statistics. Air quality standards for some pollutants (PM2.5 and Pb) allow for combining data from multiple monitors into a site-level summary statistic that can be compared to the standard. In those cases, the site-level statistics may differ from the monitor-level statistics upon which this report is based.

Exceptional Events: Included (if any)
About this report <about-air-data-reports#con>

EPA Air Quality Standards:
Carbon Monoxide: 35 ppm (1-hour), 9 ppm (8-hour)
Nitrogen Dioxide: 100 ppb (1-hour), 53 ppb (annual)
Ozone: 0.12 ppm (1-hour), 0.070 ppm (8-hour)
Sulfur Dioxide: 75 ppb (1-hour), 140 ppb (24-hour), 30 ppb (annual)
PM2.5: 35 ug/m3 (24-hour), 12.0 ug/m3 (annual)
PM10: 150 ug/m3 (24-hour)
Lead: 0.15 ug/m3 (3-month avg)
Statistics in **red** are above the level of the respective air quality standard.

The following data links are active for the next 10 minutes, after which you must resubmit your query.

Ambient Air Quality Construction (Carbon Monoxide)

Averaging Time	CO Background (ppm)**	CO Background (mg/m3)	CO from Project (ug/m3)*	CO from Project (mg/m3)*	Combined CO (mg/m3)	CAAQS	NAAQS	Exceed?
1 Hour	2.5	2.86400818	13.98	0.01398	2.87798818	20 ppm (23 mg/m3)	35 ppm (40 mg/m3)	No
8 Hour	1.7	1.947525562	9.77	0.00977	1.957295562	9.0 ppm (10 mg/m3)	9 ppm (10 mg/m3)	No

*approximately 10 meters from the site

** USEPA. 2023. Air Quality Statistics Report. Website: https://www.epa.gov/outdoor-air-quality-data/air-quality-statistics-report Background concentrations for San Joaquin County.

Conversions:

$$\text{Concentration (mg/m}^3\text{ or µg/L)} = \text{Concentration (ppm)} \times \frac{\text{Molecular mass (g/mol)}}{\text{Molar volume (L)}}$$

$$\text{Concentration (µg/m}^3\text{ or ng/L)} = \text{Concentration (ppb)} \times \frac{\text{Molecular mass (g/mol)}}{\text{Molar volume (L)}}$$

For more information on calculating atmospheric concentrations, refer to Application Note 025.

Note that the ppm and ppb concentrations in these formulae are by volume, and the molar volume at 1 atm and 25°C is 24.45 L.

Molecular mass of CO = 28.01 g/mol

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =     93000.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.
         6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  CO
```

```
 **Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR

 **This Run Includes:      1 Source(s);       1 Source Group(s); and     246
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      1 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   158.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                 ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

*approximately 10 meters from the site

** USEPA. 2023. Air Quality Statistics Report. Website: https://www.epa.gov/outdoor-air-quality-data/air-quality-statistics-report Background concentrations for San Joaquin County.

Conversions:

$$\text{Concentration (mg/m}^3\text{ or µg/L)} = \text{Concentration (ppm)} \times \frac{\text{Molecular mass (g/mol)}}{\text{Molar volume (L)}}$$

$$\text{Concentration (µg/m}^3\text{ or ng/L)} = \text{Concentration (ppb)} \times \frac{\text{Molecular mass (g/mol)}}{\text{Molar volume (L)}}$$

For more information on calculating atmospheric concentrations, refer to Application Note 025.

Note that the ppm and ppb concentrations in these formulae are by volume, and the molar volume at 1 atm and 25 °C is 24.45 L.

Molecular mass of CO = 28.01 g/mol

- - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =     93000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: CO

 **Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR

 **This Run Includes:      1 Source(s);       1 Source Group(s); and     253
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
```

```
                and:      0 VOLUME source(s)
                and:      1 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   158.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   IPCP2_setup.err

 **File for Summary of Results:   IPCP2_setup.sum

ATTACHMENT E: Health Impacts Related to Ozone from the International Park of Commerce Phase 2

Stantec

Memo

To:	Philip Sidles Director, Entitlements Prologis	From:	Kaitlyn Heck Air Quality Specialist Stantec
Project/File:	International Park of Commerce Phase 2	Date:	November 18, 2025

Reference: Health Impacts Related to Ozone from the International Park of Commerce Phase 2

The Project would generate ozone precursors that have the potential to create ozone, which may result in potential health impacts to the community. In a 2018 court ruling, Sierra Club v. County of Fresno (Friant Ranch), the California Supreme Court determined that the Environmental Impact Report (EIR) was inadequate as it failed to correlate the significant increase in emissions that the project would generate to the adverse impacts on human health or explain why it is not scientifically possible to do so. The court noted that the project would result in significant impacts related to NOx and particulate matter emissions but did not explain the health impacts of these emissions as a result of the project. Considering this ruling, the following analysis details the potential adverse health effects associated with Project emissions as well as the existing modeling constraints for correlating a Project's emissions to a quantitative health impact number.

Health Impacts of Ozone

The National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS) were established by the USEPA and CARB, respectfully, to protect human health by setting the standards that state and air basins should reach. Areas that have not met these standards are considered to be in non-attainment. The San Joaquin Valley Air Basin (SJVAB) is in non-attainment for ozone and particulate matter. As such, an increase in emissions of particulate matter or ozone precursors (ROG and NOx) has the potential to push the region further from reaching attainment status and, as a result, are the pollutants of greatest concern in the region. Both ozone and particulate matter are known to have negative public health impacts, especially in sensitive populations like children, the elderly, and those with respiratory or cardiovascular heart problems. This analysis focuses on the health impacts from ozone.

As discussed in Section 3.3.1 of the Draft EIR, adverse health effects induced by ozone include short-term effects such as coughing, difficulty breathing, and sore throat as well as long-term effects including inflamed or damaged airways, aggravated lung diseases like asthma or bronchitis, and increased frequency of asthma attacks.[1]

Ozone Creation and Transport

Ozone is created through chemical reactions between NOx, ROG, and oxygen. Ozone creation can occur near the ground (troposphere) or higher in the atmosphere (stratosphere). Stratospheric ozone is created 10 to 30 miles above Earth's surface and creates the ozone layer than shields the surface from ultraviolent

[1] USEPA. 2024. Health Effects of Ozone Pollution. Website: https://www.epa.gov/ground-level-ozone-pollution/health-effects-ozone-pollution. Accessed October 22, 2024.

radiation. Tropospheric ozone is created through chemical reactions between ozone precursors (NOx and ROG), oxygen, and sunlight. [2]

The formation of ozone is dependent upon various regional factors including the presence of ozone precursors and oxygen in the atmosphere, geography of the given area, the presence of solar energy, as well as meteorological and climatological conditions. Since ozone is created through chemical reactions, ozone transport throughout the region can occur carrying ozone precursors from industry, vehicle exhaust, and other sources from within and outside the San Joaquin Valley Air Basin to the Project area. Similarly, ozone precursors generated from the Project may be transported over wide areas outside the air basin. The potential transport of ozone precursors in and out of the region means that it is difficult to attribute the background level of ozone and the associated health risks to any single project.

Ozone Modeling Constraints

In 2019, the Congressional Research Service (CRS) prepared the Background Ozone: Challenges in Science and Policy report for the United States Congress.[3] This report provides a summary of the scientific capabilities of measuring ozone and explains the improvements necessary to understand contributions from background sources of ozone. While this paper specifically addresses background concentration and ozone modeling, it demonstrates the difficulty in assessing ozone and related health implications from any single source or project. According to the CRS, there are several data and analytical challenges to reliably assess background ozone concentrations and to model ozone, including, but not limited to, the following:

(1) The current understanding of the amount, location, and type of pollutant emissions from many types of sources is insufficient for accurately estimating ozone. Therefore, emissions inventories typically provide estimation, which may not be precise enough for apportioning contributions.

(2) Meteorological data (i.e. wind speed, wind direction, temperature, cloud cover, humidity, etc.) is not currently measured at a fine enough spatial scale to adequately represent relevant weather processes related to the formation of ozone.

(3) Data on pollutant concentrations are limited, which increases the challenges of understanding ozone formation and movement. Fine spatial and temporal measurements of ambient air conditions are needed both horizontally across the surface and vertically to higher levels of the atmosphere to accurately estimate ozone formation.

(4) Background ozone source contributions vary by year, season, day, and hour as well as from location to location.

USEPA Models

There are several models and tools currently available to quantify pollutant concentrations and estimate the associated health impacts. However, as identified by CRS, these models are limited by a number of factors in their ability to determine health impacts of individual development projects. The USEPA performs health impact assessments using the Community Multiscale Air Quality (CMAQ) modeling system for pollutant transport modeling and the Environmental Benefits Mapping and Analysis Program – Community Edition (BenMAP-CE) for health impact calculations. CMAQ was designed for regulatory and policy analysis to

[3] CRS. 2019. Background Ozone: Challenges in Science and Policy. Website: https://crsreports.congress.gov/product/pdf/R/R45482. Accessed October 22, 2024.

understand the interactions of atmospheric chemistry and physical processes.[4] BenMAP-CE calculates the economic value and number of air pollution related deaths or illnesses and is often used by policy makers.[5] These models are designed to estimate health impacts over a large scale (e.g., region-wide, state-wide).

Therefore, the current suite of available models are not able to accurately model concentrations or dispersion of ozone at a small scale because they are designed for a regional, state, or even national scale. If reliable ozone concentrations at a smaller scale can be determined, there is also a technical inability to be able to correlate concentrations from a single source to related health effects.

Air District's Response to Friant Ranch

SJVAPCD and SCAQMD Amicus Briefs

The SJVAPCD has acknowledged that while health risk assessments (HRAs) for localized air toxic impacts (i.e. diesel particulate matter) are commonly prepared, the currently available modeling tools are not equipped to provide a meaningful analysis of the correlation between an individual development project's criteria air pollutant emissions and specific human health impacts.[6] The South Coast Air Quality Management District (SCAQMD) states that based on their own modeling in the SCAQMD's 2012 Air Quality Management Plan, a reduction of 432 tons (864,000 pounds) per day of NOx and a reduction of 187 tons (374,000 pounds) per day of ROG would reduce ozone levels at the highest monitored site by only nine parts per billion. For reference, the NAAQS for 8 hour ozone is 0.070 parts per million (ppm). In the SCAQMD, the basin maximum measured 8-hour ozone was 0.139 ppm in 2020.[7] The NOx and ROG reductions would reduce monitored ozone by 9 parts per billion (0.009 ppm). As such, the reduction would only reduce background levels of ozone by approximately 0.6%. Based on minor reduction of background ozone levels as compared to the reductions in ozone precursors, SCAQMD concluded that it is not currently possible to accurately quantify ozone-related health impacts caused by NOx or ROG emissions from relatively small projects (defined as projects with regional scope) due to photochemistry and regional model limitations.[8] Therefore, based on SCAQMD's analysis, the annual Project emissions, which are significantly lower than the 432 tons per day of NOx and 187 tons per day of ROG analyzed by the SCAQMD, would not result in noticeable changes to the background concentration of ozone.

SMAQMD Guidance to Address the Friant Ranch Ruling for CEQA Projects

In 2020, the Sacramento Metropolitan Air Quality Management District (SMAQMD) released the Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District.[9] The guidance document evaluated the health risks associated with ozone around SMAQMD, evaluating 41 sites emitting criteria air pollutant emissions right at threshold levels (to represent "minor projects", or development

projects below thresholds) and six sites that exceed thresholds (to represent "strategic area projects"). For these six sites, the analysis evaluated the health risks from ozone under two scenarios:

(1) assuming each project emits twice as much as thresholds; and

(2) assuming each project emits eight times as much as thresholds.

SMAQMD's guidance recommends the health risks include quantifying the number of increased incidences of asthma related emergency room visits, non-accidental deaths, and respiratory hospital admissions as compared to a future, 2035 baseline. Table 1 shows the maximum additional incidences of health impacts from ozone in the hypothetical scenarios from the SMAQMD guidance where NOx and ROG emissions exceed thresholds by 2 (low) and 8 (high) times.

Table 1: Maximum SMAQMD Health Effects Results for Strategic Area Projects

Species	Precursor	Health Endpoint	Age Range	Incidence Increases per Year (Mean) – Lowest[1, 2]	Incidence Increases per Year (Mean) – Highest[2, 3]
Ozone	NOx	Hospital Admissions, All Respiratory	65-99	0.193	0.689
Ozone	NOx	Mortality, Non-Accidental	0-99	0.142	0.442
Ozone	NOx	Emergency Room Visits, Asthma	18-99	1.52	4.30
Ozone	NOx	Emergency Visits, Asthma	0-17	0.812	2.55
Ozone	ROG	Hospital Admissions, All Respiratory	65-99	0.0182	0.0749
Ozone	ROG	Mortality, Non-Accidental	0-99	0.0115	0.0472
Ozone	ROG	Emergency Room Visits, Asthma	18-99	0.160	0.657
Ozone	ROG	Emergency Visits, Asthma	0-17	0.099	0.628

Source: SMAQMD. 2020. Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District.
[1] These are the incidence increases from the 2035 baseline when emissions exceed thresholds by two times the limit (164 lbs/day).
[2] These are the highest incidences reported for each health endpoint for the six study locations.
[2] These are the incidence increases from the 2035 baseline when emissions exceed thresholds by eight times the limit (656 lbs/day).

SMAQMD's analysis demonstrate that even at emissions of NOx and ROG over eight times the SMAQMD threshold, the increased emissions from a single project would not meaningfully increase ozone health incidences.

IPC2 is located within SJVAPCD. SJVAPCD's NOx and ROG thresholds are each 10 tons per year. Therefore, by applying SJVAPCD thresholds to SMAQMD's methodology, projects within SJVAPCD that emit two to eight times higher than thresholds would emit 20 and 80 tons per year, respectively. This is approximately 33% lower for both the low and high estimates.[10] As such, assuming all other inputs would

[10] The low estimate for SMAQMD's methodology is 164 lbs/day (29.93 tons/year). The high estimate for SMAQMD's methodology is 656 lbs/day (119.72 tons/year).

be the same, then the health effects for strategic area projects within SJVAPCD would be 33% lower than those presented in Table 1. It should be noted due to the challenges in modeling ozone including regional emission sources, ozone transport, and the chemical reaction required to produce ozone that these reductions are demonstrative.

Project Analysis

Project Emissions Compared to SMAQMD's Health Effects Results for Strategic Area Projects

As discussed above, the SMAQMD's Strategic Area Projects analysis from the Guidance to Address the Friant Ranch Ruling for CEQA Projects in the SMAQMD used emission rates two to eight times higher than thresholds from the air districts within the Sacramento Area Air Basin. As shown in Table 2, the Project's ozone precursor emissions would be less than those evaluated within the Strategic Area Projects analysis. As such, it can be concluded that ROG and NOx emissions attributable to the Project would result in a reduced increase in adverse health incidences than identified in Table 1.

Table 2: Project Emissions Relative to SMAQMD Evaluation

Pollutant	Project Emissions (lbs/day)		SMAQMD Modeled Emissions		Percent Reduction (Low)		Percent Reduction (High)	
	Unmitigated	Mitigated	Low	High	Unmitigated	Mitigated	Unmitigated	Mitigated
Construction								
ROG[1]	47.89	29.32	164	656	-70.80%	-82.12%	-92.70%	-95.53%
NOx	146	22.9	164	656	-11.00%	-86.04%	-77.74%	-96.51%
Operation								
ROG[1]	163.95	54.69[2]	164	656	-0.03%	-66.65%	-75.01%	-91.66%
NOx	100.9	54.69[2]	164	656	-38.48%	-66.65%	-84.62%	-91.66%

[1] Daily ROG emissions calculated from Tables 3.3-14 through 3.3-17.

[2] Emissions are mitigated to SJVAPCD thresholds with MM AQ-3 through MM AQ-20.

Screening Analysis

SMAQMD has prepared two tools that are intended for use in analyzing health risks from criteria pollutants. Small projects with criteria pollutant emissions close to or below SMAQMD's adopted thresholds of significance may use the Minor Project Health Effect Screening Tool, while larger projects with emissions that exceed SMAQMD's adopted thresholds may use the Strategic Area Project Health Screening Tool.[11] These tools are further described below:

- **Strategic Area Project Health Screening Tool:** The screening tool is for projects that exceed thresholds and based on the six areas within the Sacramento Area Air Basin (West Roseville, Rancho Cordova, Downtown Sacramento, South Sacramento, Woodland, and Vacaville) that were used within the Guidance document to estimate risks from projects that exceed thresholds. Users select the study area and input the daily project emissions for NOx, ROG, and $PM_{2.5}$. The screening

[11] The screening tools were designed for used within the Sacramento Area Air Basin. Therefore, the background concentrations of ozone used in these tools would not accurately capture the existing background concentration of ozone at the Project site. However, the tools do serve to quantify the potential increase in health risks posed by Project level ozone regardless of background levels.

tool uses those inputs to calculate the estimated number of respiratory, cardiovascular, and mortality impacts from $PM_{2.5}$ and ozone and the regional health incidence increases.

- **Minor Project Health Effects Screening Tool.** The Minor Project Health Effects Screening Tool is an interactive spreadsheet based on the 41 study locations in SMAQMD guidance that had hypothetical projects that meet the highest thresholds for the five-air district region of the Sacramento Area Air Basin for ozone precursors and $PM_{2.5}$. Therefore, Project that emit at or below SMAQMD thresholds (82 lbs/day for ozone precursors and particulate matter) should use this tool to estimate the health risks. Results are based on the location of the Project within the air basin.

The Project's emissions for construction (unmitigated) and operational (unmitigated) would exceed thresholds. Therefore, the ozone health risks under these Project conditions were estimated with the Strategic Area Project Health Screening Tool. The Project's emissions for construction (mitigated) and operational (mitigated) would not exceed thresholds. Therefore, the ozone health risks under the construction (mitigated) Project conditions were estimated with the Minor Project Health Effects Screening Tool.

Table 3 below summarizes the Project scenario, ozone precursor emissions, and the screening tool used for the analysis.

Table 3: Applicable Screening Tool by Project Scenario

Project Scenario	Emissions (lbs/day)		Exceed SMAQMD thresholds?	Screening Tool Applicable
	ROG	NOx		
Construction (unmitigated)	47.89	146	Yes	Strategic Area Project Health Screening Tool
Construction (mitigated)	29.32	22.9	No	Minor Project Health Effects Screening Tool
Operational (unmitigated)	163.95	100.9	Yes	Strategic Area Project Health Screening Tool
Operational (mitigated)[1]	54.69	54.69	Yes	Strategic Area Project Health Screening Tool

[1] Emissions are mitigated to SJVAPCD thresholds with MM AQ-3 through MM AQ-20.

Table 4 summarizes the outputs from the Strategic Area Project Health Screening Tool and the Minor Project Health Effects Screening tools. Output files from the screening tools are included in Attachment A.

Table 4: Results of the SMAQMD Screening Tool

Health Endpoints (Age Range)	Construction				Operational			
	Unmitigated[1]		Mitigated[2]		Unmitigated[1]		Mitigated [2]	
	Incidences Across the 5-Air District Region Resulting from Project Emissions (per year)	Percent of Background Health Incidences Across the 5-Air District Region	Incidences Across the 5-Air District Region Resulting from Project Emissions (per year) (Mean)	Percent of Background Health Incidences Across the 5-Air District Region	Incidences Across the 5-Air District Region Resulting from Project Emissions (per year)	Percent of Background Health Incidences Across the 5-Air District Region	Incidences Across the 5-Air District Region Resulting from Project Emissions (per year)	Percent of Background Health Incidences Across the 5-Air District Region

[1] Modeled with the Strategic Area Project Health Effects Tool. The South Sacramento strategic location was utilized for this analysis as this site is the closest to the Project site.

[2] Modeled with the Minor Project Health Effects Tool. In order to accurately compare output data, the location for the Minor Project Health Effects Tools was set for the South Sacramento strategic location. The Minor Project Health Effects Tool accounts for emissions at SMAQMD thresholds, therefore construction (mitigated) and operational (mitigated) health impacts would be the same under this tool.

It should be noted that these screening tools were created based on CAMx PGM and USEPA's BenMAP health effects model. As discussed above, these tools are designed for the regional level, not to evaluate the impacts at the project-level. Under Project scenarios where emissions exceed thresholds (construction [unmitigated] and operational [unmitigated]), hospital emissions would increase by 0.0007%, emergency room visits (ages 65-99) increase by 0.014%, emergency room visits (ages 0-17) increase by 0.0097%, and non-accidental mortality increased by 0.00029%. Under Project scenarios where emissions were below thresholds (construction [mitigated] and operational [mitigated]), hospital emissions would increase by 0.00037%, emergency room visits (ages 65-99) increase by 0.0072%, emergency room visits (ages 0-17) increase by 0.0052%, and non-accidental mortality increased by 0.00015%. The tools demonstrate that changes to Project emissions have minimal impact on the increase in health impacts from ozone as compared to background levels.

USEPA COBRA Modeling

The USEPA has also created the Co-Benefits Risk Assessment Health Impacts Screening and Mapping Tool (COBRA), which is designed as a screening tool for state and local governments to understand the health impacts related to ozone and particulate matter less than 2.5 microns ($PM_{2.5}$) under different emissions scenarios. The tool evaluates the change in emissions, based on location and type of emissions, as compared to the existing baseline to calculate the net change in background ozone and $PM_{2.5}$. The change in background concentrations of ozone and $PM_{2.5}$ are used to calculate the net change in health risk endpoints and the associated economic impact. The tool is designed to calculate the health and economic benefits from federal, State, and County-level policies aimed at reducing emissions, but can also be used to evaluate the risks posed from an increase in emissions.[12] Therefore, negative values within the modeling represent an increase in a health risk.

For this analysis, the COBRA Web Edition was used that assumes a 2023 baseline, which is the same year as the baseline for the IPC2 analysis. The online tool requires users to select a location (National, State, or level) and an emissions sector. Emissions were evaluated for changes within San Joaquin County for the annual emissions from all four Project scenarios (construction [mitigated],[13] construction [unmitigated],[14] operational [unmitigated], and operation [mitigated]). The construction Project scenarios assumed as emissions sector of "Off Highway" and the "Non-Road Diesel" subsector. Since most Project emissions during operation would be generated from vehicle trips, the operational Project scenarios assume an emissions sector of "Storage & Transport" and the "Bulk Materials" subsector.[15] It should be noted that the modeling accounts for one year of construction emissions (assuming the highest emissions per pollutant throughout construction) and the first full year of operation. Therefore, the outputs represent the annual change in ozone concentration and health endpoints under the worst-case scenarios.

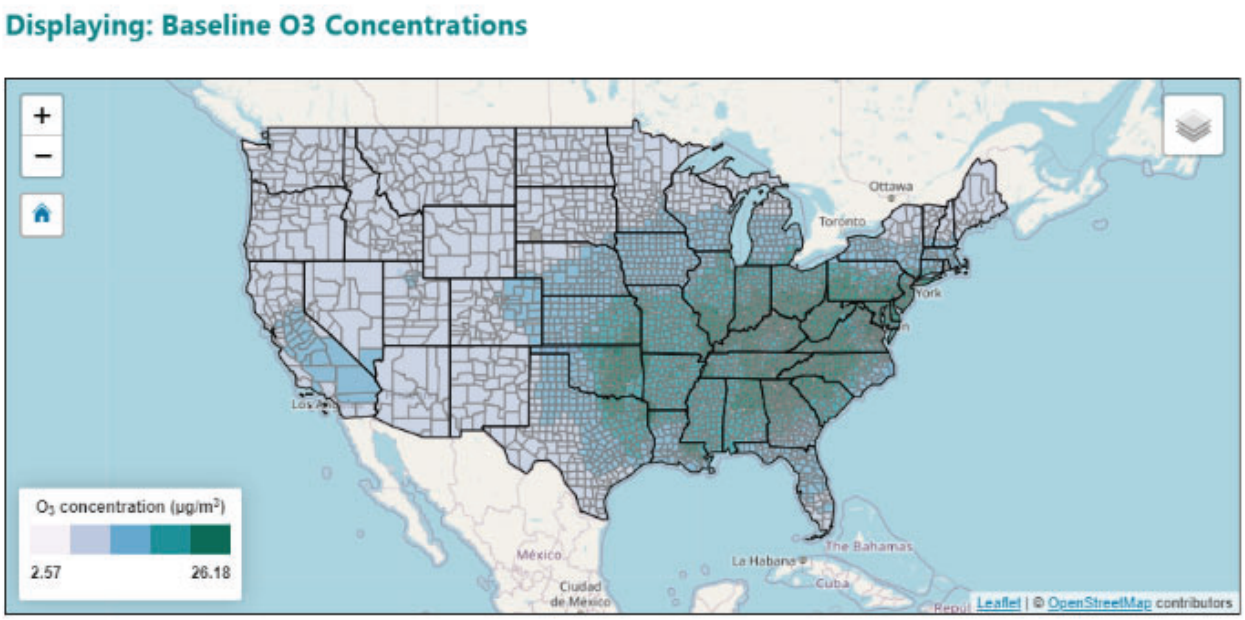
The COBRA modeling tool provides mapping of the baseline, Project scenario, and delta ozone concentrations across the United States. Figure 1 shows the baseline ozone concentration across the United States, which ranges from 2.57 µg/m^3 to 26.18 µg/m^3.

Figure 1: Background Ozone for Off-Highway, Non-Road Diesel

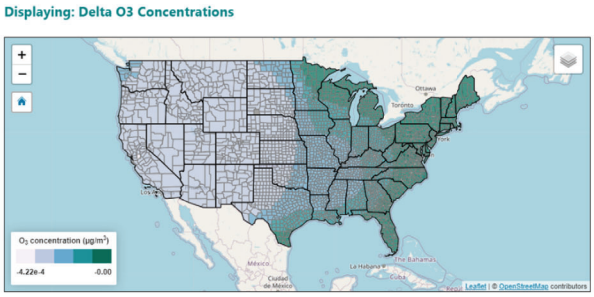


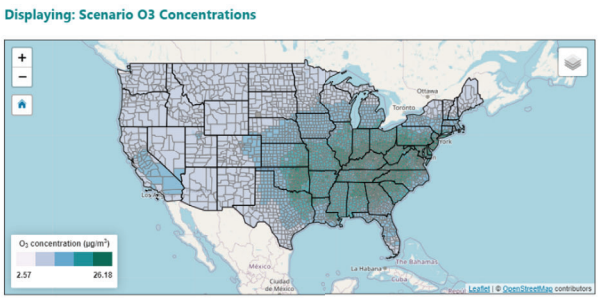
The mapping of the ozone concentrations for each construction Project scenario are provided in Figure 2. Figure 2 shows the change in ozone concentration and scenario ozone concentration across the United States under the construction Project scenario's emission levels.

Figure 2: Delta and Scenario Ozone Concentrations for Project Construction Scenarios

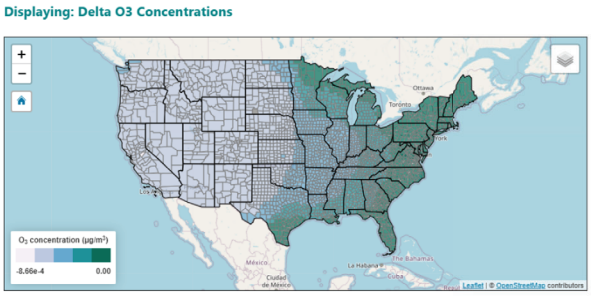
Reference: **Health Impacts Related to Ozone from the International Park of Commerce Phase 2**

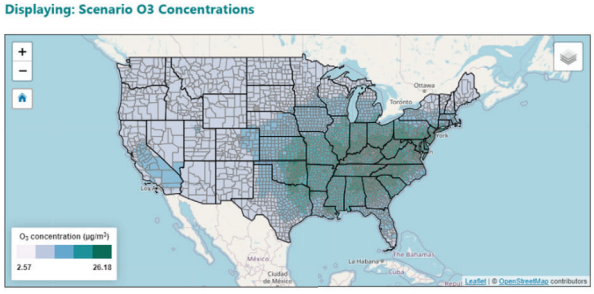
Construction (unmitigated)





Construction (mitigated)





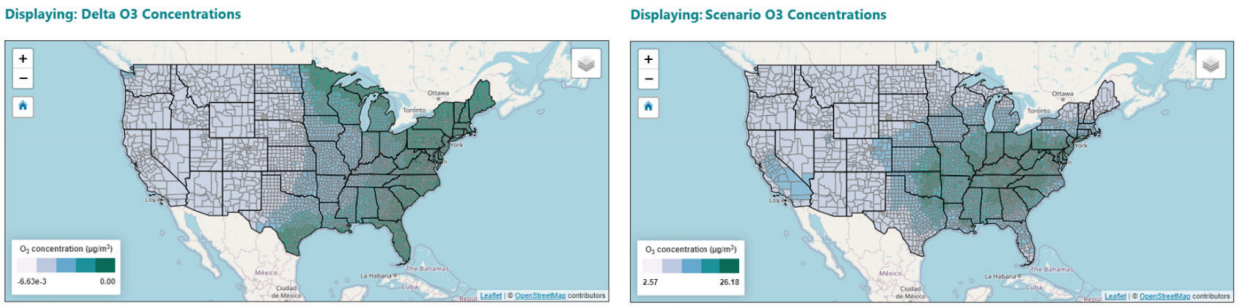
As shown in Figure 2, Project construction (unmitigated and mitigated) would result in minor increases in ozone concentration when viewed independently of the background concentrations (Delta O_3 Concentrations maps). When the construction Project scenarios are cumulatively viewed with the existing background concentration of ozone, the Scenario O_3 Concentrations mapping demonstrates that the construction Project scenarios would not result in emissions that would change the background levels of ozone as compared to baseline conditions, see Figure 1. As shown in the Scenario O_3 Concentrations mapping, the background concentration of ozone would continue to range from 2.57 µg/m^3 to 26.18 µg/m^3.

The mapping of the ozone concentrations for each operational Project scenario are provided in Figure 3. Figure 3 shows the change in ozone concentration and the scenario ozone concentration across the United States under the operational Project scenario's emission levels.

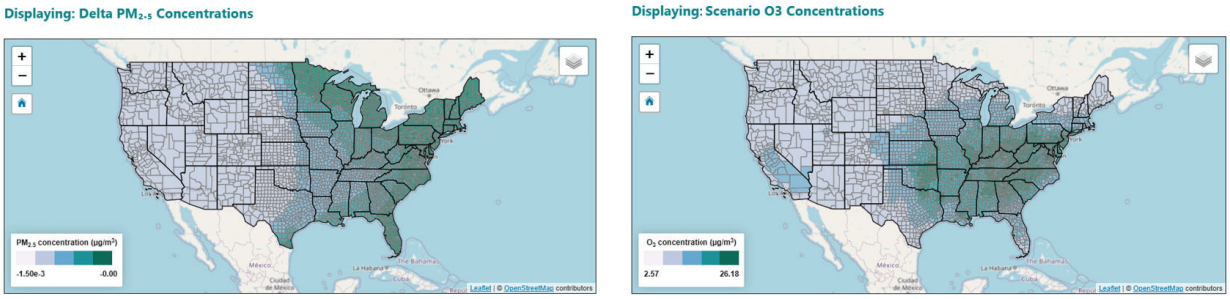
Reference: **Health Impacts Related to Ozone from the International Park of Commerce Phase 2**

Figure 3: Delta and Scenario Ozone Concentrations for Project Operational Scenarios

Operational (unmitigated)



Operational (mitigated)



As shown in Figure 3, Project operation (unmitigated and mitigated) would result in minor increases in ozone concentration when viewed independently of the background concentrations (Delta O3 Concentrations maps). When the operational Project scenarios are cumulatively viewed with the existing background concentration of ozone, Scenario O_3 Concentrations mapping demonstrates that the operational Project scenarios would not result in emissions that would change the background levels of ozone as compared to baseline conditions, see Figure 1. As shown in the Scenario O_3 Concentrations mapping, the background concentration of ozone would continue to range from 2.57 µg/m^3 to 26.18 µg/m^3.

COBRA uses the change in ozone concentration to calculate the increase or decrease in health risk endpoints. Table 5 summarizes the outputs from COBRA, focusing on the increase in health endpoints within California and San Joaquin County. Output files from the screening tools are included in Attachment B. This analysis focuses on the health impacts of ozone, therefore only ozone health endpoints are presented in Table 5. Moreover, since COBRA is designed to calculate the health benefits, negative numbers represent an increase in health incidences.

Table 5: Results of the COBRA Screening Tool

Health Endpoints	Construction				Operational			
	Unmitigated		Mitigated		Unmitigated		Mitigated	
	Changes in Incidences (Across California)	Changes in Incidences (Across County)	Changes in Incidences (Across California)	Changes in Incidences (Across County)	Changes in Incidences (Across California)	Changes in Incidences (Across County)	Changes in Incidences (Across California)	Changes in Incidences (Across County)

As shown in Table 5, when modeled via COBRA, the health endpoints decrease as ROG and NOx emissions decrease through mitigation. Review of the construction (unmitigated) and construction (mitigated) health endpoints reveal that the health risk endpoints are reduced by approximately half with the implementation of mitigation. Across the County, with mitigation, the increase in incidences of any single asthma symptom (chest tightness, wheezing, coughing, shortness of breath) would be less than two and, in total, the incidence of any of one of these symptoms would increase by 5.82. San Joaquin County has a population of approximately 800,000 people.[16] Therefore, based on the modeling, approximately 0.0007% of the population could experience increased incidences of asthma symptoms as a result of annual Project construction. Additionally, up to 3.7 school days within the County would be missed per year as a result of mitigated construction emissions. According to the US Census Bureau, approximately 25.9% of the population is under 18.[17] Assuming everyone under 18 attends school, then there are approximately 207,200 school aged children who would each attend approximately 180 days in the school year. Therefore, the loss of 3.7 school days is approximately 0.00001% of the total annual school days. It should be noted that this calculation assumed one-year of construction that assumes the worst-case emissions per pollutant. Conservatively expanding the risks to a 10-year period, then up to 0.007% of the County's population would experience asthma symptoms and a total of 0.0001% of school days would be missed. However, as construction equipment and on-road vehicles are required to meet stricter emissions standards over time, construction ROG and NOx emissions and, in turn, ozone emissions and the correlating health impacts, would decrease over the course of Project construction.

For operation (unmitigated) and operation (mitigated) health endpoints reveal that the health risk endpoints are reduced the implementation of mitigation. For example, hospital admissions (all respiratory) would be reduced by half and the number of lost school days would be reduced by over 75 percent. Across the County, with mitigation, the increase in incidences of any single asthma symptom (chest tightness, wheezing, coughing, shortness of breath) would be less than three and, in total, the incidence of any of one of these symptoms would increase by 9.2. As stated above, San Joaquin County has a population of approximately 800,000 people.[18] Therefore, based on the modeling, approximately 0.0012% of the population could experience increased incidences of asthma symptoms as a result of annual Project operation. Additionally, up to 5.7 school days within the County would be missed per year as a result of mitigated operational emissions, approximately 0.000014% of the total annual school days. It should be noted that this calculation assumed one-year of operation that assumes the worst-case emissions per pollutant. Conservatively expanding the risks to a 30-year operational period, then up to 0.04% of the County's population would experience asthma symptoms and a total of 0.00042% of school days would be missed. However, as on-road vehicles are required to meet stricter emissions standards over time, operational ROG and NOx emissions and, in turn, ozone emissions and the correlating health impacts, would decrease over the course of Project operation.

Conclusion

As discussed by SCAQMD, SJVAPCD, and the CRS, ozone modeling is not refined enough at this point to accurately assess the health risks posed by an individual project. Regardless, a screening level analysis was prepared with SMAQMD ozone tools and USEPA's COBRA. For the SMAQMD ozone tools, under all Project scenarios, the increase in ozone health endpoints from the Project would be less than 0.015% for all health endpoints under all scenarios. This represents a negligible increase in health risks as compared to background levels of ozone. Within the COBRA modeling, changes in Project emission levels were found to result in slightly lower, but similarly negligible increases in ozone health endpoints. As such, relative to the background levels of ozone, the Project would represent an insignificant increase in ozone related health impacts. Additionally, national background ozone levels would not increase as a result of annual Project emissions under any scenario. Review of the health risk endpoints also demonstrates minor increases in risk as compared to baseline conditions.

1. Affected age ranges are shown. Other age ranges are available, but the endpoints and age ranges shown here are the ones used by the USEPA in their health assessments. The age ranges are consistent with the epidemiological study that is the basis of the health function.

2. Health effects are shown in terms of incidences of each health endpoint and how it compares to the base (2035 base year health effect incidences, or "background health incidence") values. Health effects are shown for the Reduced Sacramento 4-km Modeling Domain and the 5-Air-District Region.

3. The percent of background health incidence uses the mean incidence. The background health incidence is an estimate of the average number of people that are affected by the health endpoint in a given population over a given period of time. In this case, the background incidence rates cover the 5-Air-District Region (estimated 2035 population of 3,271,451 persons). Health incidence rates and other health data are typically collected by the government as well as the World Health Organization. The background incidence rates used here are obtained from BenMAP.

4. The total number of health incidences across the 5-Air-District Region is calculated based on the modeling data. The information is presented to assist in providing overall health context.

5. The technical specifications and map for the Reduced Sacramento 4-km Modeling Domain are included in Appendix A, Table A-1 and Appendix B, Figure B-2 of the *Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District.*

COBRA Web Edition

CO-Benefits Risk Assessment (COBRA) is a screening tool that enables state, local, and tribal government staff and others interested in the effects of air pollution to estimate the air quality and health benefits of different emissions scenarios.

You are using the web-based version of COBRA. For the COBRA desktop application, visit the COBRA download page.

Step 1: Build Scenario

Complete the sections below and click "Add to Scenario."

A. Select Location REQUIRED

Select the states or counties where the emissions changes will occur.

- South Carolina
- South Dakota
- Tennessee
- Texas
- Utah
- Vermont
- Virginia
- Washington
- West Virginia
- Wisconsin

Select All | Deselect All

B. Select Sector REQUIRED

Select the industry or sector where the emissions changes will occur.

Sector

Select a sector

Subsector (optional)

All subsectors

Subsector (optional)

All subsectors

C. Modify Emissions REQUIRED

Enter emissions changes for **at least one** of the four pollutants below.

$PM_{2.5}$

reduce by | increase by

enter # (tons) (percent)

SO_2

reduce by | increase by

enter # (tons) (percent)

An official website of the United States government.

COBRA Web Edition

CO-Benefits Risk Assessment (COBRA) is a screening tool that enables state, local, and tribal government staff and others interested in the effects of air pollution to estimate the air quality and health benefits of different emissions scenarios.

You are using the web-based version of COBRA. For the COBRA desktop application, visit the COBRA download page.

Step 1: Build Scenario

Complete the sections below and click "Add to Scenario."

A. Select Location REQUIRED

Select the states or counties where the emissions changes will occur.

- South Carolina
- South Dakota
- Tennessee
- Texas
- Utah
- Vermont
- Virginia
- Washington
- West Virginia

Select All | Deselect All

B. Select Sector REQUIRED

Select the industry or sector where the emissions changes will occur.

Sector

Select a sector

Subsector (optional)

All subsectors

Subsector (optional)

All subsectors

C. Modify Emissions REQUIRED

Enter emissions changes for **at least one** of the four pollutants below.

An official website of the United States government.

COBRA Web Edition

CO-Benefits Risk Assessment (COBRA) is a screening tool that enables state, local, and tribal government staff and others interested in the effects of air pollution to estimate the air quality and health benefits of different emissions scenarios.

You are using the web-based version of COBRA. For the COBRA desktop application, visit the COBRA download page.

Step 1: Build Scenario

Complete the sections below and click "Add to Scenario."

A. Select Location REQUIRED

Select the states or counties where the emissions changes will occur.

- Tennessee
- Texas
- Utah
- Vermont
- Virginia
- Washington
- West Virginia
- Wisconsin
- Wyoming

Select All | Deselect All

B. Select Sector REQUIRED

Select the industry or sector where the emissions changes will occur.

Sector

Select a sector

Subsector (optional)

All subsectors

Subsector (optional)

All subsectors

C. Modify Emissions REQUIRED

Enter emissions changes for **at least one** of the four pollutants below.

$PM_{2.5}$

reduce by | increase by

enter # (tons) (percent)

SO_2

reduce by | increase by

enter # (tons) (percent)

NO_x

reduce by | increase by

enter # (tons) (percent)

VOC

reduce by | increase by

enter # (tons) (percent)

NH_3

reduce by | increase by

enter # tons percent

ADD TO SCENARIO

Step 2: Review Scenario

Review the scenario below. To add changes to more locations or sectors, repeat Step 1 to continue building your scenario.

Location(s)	Sector	Emissions Modification(s)	
San Joaquin, California	Storage & Transport Bulk Materials Transport	$PM_{2.5}$ increase by 13.97 tons SO_2 increase by 1.29 tons NO_x increase by 10 tons VOC increase by 10 tons	✕
