Reference: Air Quality and Greenhouse Gas Modeling Assumptions Memorandum

The Air Quality and Greenhouse Gas Modeling Assumptions Memorandum (Memo) was prepared to present the models and modeling assumptions that will be used to calculate criteria air pollutant and greenhouse gas (GHG) emissions that would be generated from the construction and operation of the International Park of Commerce (IPC), Phase 2 (Project). The Project site lies within the San Joaquin Valley Air Pollution Control District (SJVAPCD) and, as such, the modeling will be consistent with the SJVAPCD's Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI).

1 Project Description

The Project proposes to construct 5.36 million square feet of building space including warehousing and industrial buildings as well as a water and wastewater treatment plant, parking, landscaping, and roadways. The Project proposes to construct 5.36 million square feet of warehousing and industrial development as well as a water and wastewater treatment plant, parking, landscaping, and roadways. The Project would be constructed in three phases (as described in Section 3.1.2). In general, Phase 1 would construct the utilities including the fire system, water, and wastewater treatment systems. Phase 2 would construct Industrial Buildings 1 through 3 as well as their associated parking, infrastructure expansion, and roadways. Phase 3 would construct Buildings 4 and 5 as well as their associated parking, infrastructure expansion, and roadways. Phases 1-2 will overlap to construct the northern portion of the Project site. Phase 3 will develop the southern portion of the Project site and is anticipated to begin construction as Phase 1 and Phase 2 become fully operational. The air quality analysis will include an evaluation of the Project's construction emissions, operational emissions, and emissions from the overlap of Phase 1-2 operation and Phase 3 construction.

2 Model and Emission Factors Selection

2.1 CalEEMod

SJVAPCD recommends that land use development projects are modeled with the California Emissions Estimator Model (CalEEMod). CalEEMod is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutants and GHG emissions associated with both construction and operations from a variety of land use projects. CalEEMod quantifies direct emissions from construction and operation activities (including vehicle use), as well as indirect emissions, such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use. Further, CalEEMod identifies mitigation measures to reduce criteria pollutant and GHG emissions along with calculating the benefits achieved from measures chosen by the user.

CalEEMod version 2022.1.1.14 is the latest model version at the time this Memo is being prepared. The most recent iteration of CalEEMod available when air emissions are calculated will be used.[1]

Stantec proposes to prepare three CalEEMod models that include: (1) Phase 1 and 2 model for construction and operation; (2) Phase 3 model for construction and operation; and (3) baseline Project site conditions. This modeling breakdown allows Stantec to evaluate the construction emissions that overlap (Phase 1 and 2) and account for the overlap in emissions from Phase 1 and 2 operation and Phase 3 construction, and net operational emissions at full buildout. Inputs into the modeling are discussed in Sections 3.1 and 3.2.

2.2 EMFAC

The California Air Resources Board (CARB) developed on-road Emissions Factors (EMFAC) to provide vehicle emission rates by vehicle type, fuel type, fleet year, and geography across the state. The model provides emission rates as grams of a pollutant per mile traveled or per trip. The latest iteration of EMFAC takes into account the most recent regulations and technological advances that aim to reduce fleetwide emissions over time. EMFAC2021 version 1.2 is the latest model version at the time this Memo is being prepared. The most recent iteration of EMFAC available when air emissions are calculated will be used.[2]

2.3 i-Tree Planting Calculator

The i-Tree Planting Calculator was developed by the United States Department of Agriculture (USDA) Forest Service to quantify the environmental benefits from trees.[3] The i-Tree platform will be used to calculate the loss of carbon sequestration (GHG) capacity due to the loss of almond trees as well as the carbon capture potential of the new trees on the site. Inputs into the modeling are discussed in Section 3.3.

3 Criteria Air Pollutants and GHGs Assessment

3.1 Criteria Air Pollutants

The following criteria air pollutants will be assessed in the analysis: Reactive organic gases (ROG), nitrous oxides (NO_X), particulate matter less than 10 microns (PM_{10}), and particulate matter less than 2.5 microns ($PM_{2.5}$).

3.2 GHGs

The Project would generate a variety of GHGs, including several defined by Assembly Bill (AB) 32 such as carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). GHG emissions associated with Project construction, as well as future operations, were estimated using carbon dioxide equivalent (CO_2e) emissions as a proxy for all GHG emissions. Construction GHG emissions will be amortized over the lifetime of the Project (assumed to be 30 years). In order to obtain the CO_2e, an individual GHG is multiplied by its global warming potential (GWP). The GWP designates, on a pound for pound basis, the potency of the GHG compared to CO_2.

4 Assumptions

4.1 Baseline Modeling

The existing site is used for agriculture with almond trees planted across the site. As an active orchard, the site generates emissions from workers and truck trips to the site, water transport, harvest operations, and pesticide application. The baseline modeling will be used to find the net operational emissions.

[3] USDA. 2023. I-Tree Planting Calculator. https://planting.itreetools.org/app/location/. Accessed July 2023.

4.1.1 VEHICLE TRIPS

The existing site is assumed to generate 42 employees, based on an employment rate of 0.15 employees per acre of orchard.[4] Therefore, employees were estimated to make 84 vehicles trips per day. Moreover, crop production for mature almond trees is estimated to be approximately 0.9-1.6 tons per acre.[5] As such, the existing site would produce between 255.6 and 454.4 tons of almonds per year. CalEEMod assumes that hauling trucks have a carrying capacity of 20 tons per truckload (see Section 4.2.1.4). Therefore, the existing site would generate 26 to 46 heavy-duty truck trips per year.

4.1.2 HARVEST OPERATIONS

Typical almond harvest operations include weed and debris clearing, tree shaking to remove the nut from the tree, and collection from the ground. Almond harvest takes place from mid-August through October.[6] The following equipment, hours per day, and days per year were assumed for this analysis.

Table 1: Existing Use Equipment

Equipment	Modeled Equipment	Number	Hours of Operation per Day	Days per Year
Trucks	Off-Road Truck	2	8	60
Shaking Machines	Tractors/Loaders/Backhoes	2	8	20
Sweeping Machines	Tractors/Loaders/Backhoes	2	8	20
Almond Harvesters	Tractors/Loaders/Backhoes	2	8	20

4.1.3 WATER USE

Kier and Wright prepared a Water Supply Assessment (WSA) in June 2023 to estimate the water use of the existing site and the Project. The WSA concluded that the existing site uses approximately 1,500 AFY of water.

4.2 Phase 1, Phase 2, and Phase 3 Modeling

4.2.1 CONSTRUCTION MODELING ASSUMPTIONS

4.2.1.1 Land Use

The Project is anticipated to construct a maximum of 5.36 million square feet of building space that includes industrial buildings, parking, roadways, water treatment facilities, sewer treatment facilities, and landscaping over a 284-acre site.

The industrial land use types and sizes were derived from the Fehr and Peers Traffic Impact Analysis (TIA) scope of work prepared in June 2023. The breakdown of industrial land uses modeled within CalEEMod as compared to the Institute of Transportation Engineers land uses provided in the TIA scope of work and are included in Table 1. The land uses and land use sizes disclosed in Table 1 present the maximum square footage of total industrial buildout. This land use breakdown is considered conservative assumption of how buildout may occur on the site.

The other, non-industrial land use types and sizes (roadways, water treatment facilities, sewer treatment facilities, and parking) were derived from the March 24, 2023 IPC – Phase 2 Draft Specific Plan prepared by Prologis LLC. The landscaping area was calculated based on details provided within the Master Landscape Plan detailed within the Specific Plan. Specifically, the Master Landscape Plan states that landscaping elements would be included as part of the roadways, intersections, and pedestrian and bicycle facilities with landscape setbacks of 25 to 30 feet. Based on the proposed roadway acreage (9.6 acres), the average setback distance on each side of the road (27.5 feet), and the average roadway width (36 feet[7, 8]), it was assumed that the total landscaping area is approximately 638,880 square feet (14.7 acres).

The Project would buildout 277.6 acres across the site. Based on the, the Project would also include five detention basins that range from one to 2.5 acres. For this analysis, it was assumed that 8.75 acres would be detention basins which are not modeled as individual land uses, but instead modeled as part of Project grading. Project land uses modeled within CalEEMod are provided in Table 2. Details regarding phasing are provided within Section 3.1.2.

---

[7] According to the California Department of Transportation (Caltrans), the average roadway width is 12 feet, see: https://dot.ca.gov/-/media/dot-media/programs/design/documents/chp0300-032020.pdf#:~:text=The%20preferred%20lane%20width%20is%2012%20feet.%20See,interchange%2C%20the%20lane%20width%20shall%20be%2012%20feet.
The proposed roadways would be 2-4 lanes. Therefore, the width of the roadways are assumed to be an average of 36 feet.

[8] 9.6 acres of roadway is approximately 418,176 square feet. Therefore, assuming an average width of 36 feet, the length of roadway to be constructed is 11,616 feet. With an average landscape setback of 27.5 feet, and assuming landscaping on two sides of each roadway, then the average amount of landscaping is 638,880 square feet.

4.2.1.2 Construction Schedule

Construction of the Project would require various tasks including site preparation, grading, building construction, architectural coatings, and paving. There are no existing buildings or other structures on the site. As such, demolition was not included within the schedule. Overall, construction is anticipated to take place over a period of 10 years, with actual construction timing based on market conditions. Phase 1 and Phase 2 would take place over the first 5 year of construction and Phase 3 would take place over 5 years. Phase 1 and Phase 2 would overlap and, as a result, were calculated in one model. Phase 3 was modeled separately.

The northern portion of the Project site would be construction during Phase 1 (water and wastewater treatment plant) and Phase 2 (Industrial Buildings 1-3) then the southern portion of the site would be constructed during Phase 3 (Industrial Buildings 4-5). As such, three-fifths of the proposed industrial building space, roadways, parking, and landscaping as well as the utility infrastructure would be modeled to occur during Phase 1 and 2.

Due to increasingly stringent regulations and advances in technology, construction emissions generally become lower if later years of construction are assumed. Therefore, in the event that construction begins at a later date or Phase 3 would actually construct Building 3 then emissions would actually be lower than analyzed within the CalEEMod modeling.

Table 3 shows the anticipated construction schedule.

4.2.1.3 Construction Equipment

The off-road equipment fleet for construction was generated using default values from CalEEMod. CalEEMod generates construction fleets for construction activities based on the size of the construction areas derived from a South Coast Air Quality Management District (SCAQMD) survey. The survey is limited to mid-sized projects with the maximum acreage of 34 acres.[9] As a result, the modeling is limited to estimating construction equipment from a maximum site size of 34 acres. To account for this limitation in the modeling, the amount of equipment required based on defaults were multiplied by a factor consistent with the acreage to be developed during each phase. Phases 1 and 2 would construct approximately 170 acres, therefore the default equipment numbers for Phases 1 and 2 were multiplied by a factor of 5. Phase 3 would construct approximately 107 acres, therefore the default equipment numbers for Phase 3 were multiplied by a factor of 3.

Grading is also assumed to require a chipper or grinder in order to remove trees from the existing almond orchard. Construction equipment for each construction activity by phase is shown in Table 4.

4.2.1.4 Vehicle Trips

Off-site construction emissions are caused by motor vehicle exhaust from delivery vehicles, worker traffic, and road dust (PM_{10} and $PM_{2.5}$).

CalEEMod quantifies the number of construction workers by multiplying 1.25 times the number of pieces of equipment for all phases (except Building Construction and Architectural Coating). CalEEMod default values would be used to estimate the number of vendor vehicle trips, which includes cement and water trucks. The Project would include approximately 1.45 million cubic yards of material movement across the site during the construction phases. Dirt is expected to be balanced on the northern and southern sides of the Project site and moved by the on-site equipment. Therefore, there would be no hauling trips associated with graded dirt. Grading would also include the removal of on-site almond trees. Phases 1 and 2 would remove the almond trees on the northern portion of the site and Phase 3 would remove the almond trees on the southern portion of the site. No demolition would be required.

The fleet mix for worker trips consists of light-duty passenger vehicles to light-duty trucks. The vendor trips fleet mix is composed of a mixture of medium and heavy-duty diesel trucks. The hauling trips will be assumed to be 100 percent heavy-duty diesel truck trips. Employees and vendors were assumed to travel 15.5 miles which would account for vehicle travel from Manteca, Livermore, and Tracy. This mileage assumption is also more conservative than CalEEMod default trip distances of 11.89 miles for workers and 9.1 miles for vendors. The almond tree waste will be hauled to a co-generation plant within the County.

4.2.2 OPERATIONAL MODELING ASSUMPTIONS

Operational emissions are those emissions that occur during operation of the Project. Sources of emissions include vehicle trips (passenger and truck trips), area sources, on-site equipment, and indirect sources.

4.2.2.1 Motor Vehicles

Motor vehicle emissions refer to exhaust and road dust emissions from automobiles and trucks that would travel to and from the Project site. Assumptions for motor vehicles are based on the scope of work prepared by Fehr and Peers for the Project TIA. During the weekday, the site is expected to generate approximately 14,698 trips/day.

The daily trip rates for industrial land uses from the TIA scope of work is provided in Table 5. Within the modeling, the weekday trip rates will also be assumed for weekends.

Table 5: Industrial Vehicle Trip Rates

ITE Land Uses	Weekday Daily Trip Rate	Weekday Trips/Day
High-Cube Transload and Short-Term Storage Warehouse	1.40	751
High-Cube Fulfillment Center Warehouse – Sort	6.44	1,726
Warehousing	1.71	2,292

High-Cube Parcel Hub Warehouse	4.63	2,482
High-Cube Cold Storage Warehouse	2.12	1,137

General Light Industrial	4.87	2,611
Manufacturing	4.75	1,273
	Total	***14,698***

4.2.2.2 Trip Lengths

Trip lengths will be provided as part of the TIA prepared by Fehr and Peers. All trip types within the modeling will be assumed to be primary trips.

4.2.2.3 Vehicle Fleet Mix

The vehicle fleet mix is defined as the mix of motor vehicle classes active during the operation of the Project. Emission factors are assigned to the expected vehicle mix as a function of vehicle class, speed, and fuel use. Default vehicle fleet mixes from CalEEMod or EMFAC2021 will be used to estimate emissions based on the first year of operation for each phase. However, in the event the fleet mix is disclosed within the TIA, then that fleet mix will be used in the analysis. Transportation refrigeration units will also be assumed for land uses with cold storage.

4.2.3 AREA SOURCES

4.2.3.1 Consumer Products

Consumer products are various solvents used in non-industrial applications that emit ROG during their product use. These typically include cleaning supplies, kitchen aerosols, cosmetics, and toiletries. The default CalEEMod values will be used for this Project.

4.2.3.2 Architectural Coatings

Architectural coatings, such as paints and solvents, release ROG emissions. Architectural coatings would be applied during Project construction and would be reapplied during operation. CalEEMod defaults for architectural reapplications and ROG paint concentrations will be used for this purpose.

4.2.3.3 Landscaping Emissions

Based on CalEEMod defaults for San Joaquin County, it will be assumed that landscaping will take place 180 days per year.

4.2.3.4 Operational Equipment

The Project site would include the operation of a water and sewer treatment facility as well as 5.36 million square feet of industrial space. Water treatment facilities are assumed to require a water pump for each ground well.

While the end users of the industrial space are not known at this time, industrial land uses typically require some off-road operational equipment. The most common type of equipment required at an industrial warehouse is a yard tractor. Yard tractors were assumed to have a horsepower range between 175 and 200 and will be modeled as the Tractors/Loaders/Backhoes equipment type within the modeling. According to the SCAQMD, high-cube warehouse projects typically have 3.6 yard trucks per million square feet of building space.[10] For the purpose of the analysis it is assumed 3.6 yard trucks per million square feet would be required across all industrial land uses.

Table 6 includes the estimated operational equipment on the site. All yard trucks will be assumed to be diesel-powered and operate 4 hours per day for 365 days per year. The equipment for the water treatment facility will be assumed to be electric and operate 12 hours per day for 365 days per year.

Table 6: Operational Equipment

Land Use	Size	Proposed Equipment	Modeled Equipment	Amount
Phase 1 and Phase 2				
Industrial Buildings	3.216 million sf	Yard Trucks	Tractors/Loaders/Backhoes	12
Water Treatment Facility	2-3 wells	Water Pumps	Pumps	3
		Membrane Filter	Other Material Handling Equipment	1
Phase 3				
Industrial Buildings	2.144 million sf	Yard Trucks	Tractors/Loaders/Backhoes	8

4.2.3.5 Indirect Emissions

For GHG emissions, CalEEMod contains calculations to estimate indirect GHG emissions. Indirect emissions are emissions where the location of consumption or activity is different from where actual emissions are generated. For example, electricity would be consumed at the proposed Project site;

[10] SCAQMD. 2014. SCAQMD High Cube Warehouse Truck Trip Study White Paper Summary of Business Survey Results. Available online at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/high-cube-warehouse-trip-rate-study-for-air-quality-analysis/business-survey-summary.pdf.

however, emissions associated with producing that electricity are generated off-site at a power plant. Since the electricity can vary greatly based on locations, the user should override these values if they have more specific information.

4.2.3.5.1 Energy Use

Pacific Gas and Electric (PG&E) would provide electricity and natural gas services to the Project site. PG&E provides emission factors for the electricity it provides to customers for its energy portfolio that can be used to estimate project emissions. The latest iteration of the CalEEMod model accounts for the Renewable Portfolio Standard (RPS). Default energy factors in CalEEMod for PG&E will be used in the analysis.

The emissions associated with the building electricity and natural gas usage (non-hearth) will be estimated based on the land use type and size. The electricity energy use is in units of kilowatt hours per size metric for each land use type. Natural gas use is in units of one thousand British Thermal Units per size metric for each land use type. Hearths and stoves are not assumed to be used in industrial projects.

4.2.3.5.2 Water Use

According to the WSA prepared by Kier and Wright in June 2023, the Project would result in net new potable water demand of 78 acre-feet per year (AFY). Water demand during full Project buildout is provided in Table 7.

Table 7: Net Water Demand (AFY)

Land Use	Proposed Project Demand	Recycled Water Supplement	Net New Potable Demand
Industrial Buildings	58	0	58
Landscaping	73	53	20
		Total Water Demand	**78**

In the modeling, it will be assumed 60% of the water use demand would occur during Phase 1 operation (46.8 AFY) and the remaining 40% would be demanded during Phase 2 operation (31.2 AFY).

4.2.3.5.3 Other Indirect Emissions (Water Use, Wastewater Use, and Solid Waste)

CalEEMod includes calculations for indirect GHG emissions for electricity consumption, water consumption, and solid waste disposal. For water consumption, CalEEMod calculates embedded energy (e.g., treatment, conveyance, distribution) associated with providing each gallon of potable water to a project. For solid waste disposal, GHG emissions are associated with the disposal of solid waste generated by a project into landfills. CalEEMod default data will be used for inputs associated with solid waste.

4.3 i-Tree Planting Calculator Input Parameters

4.3.1 EXISTING ALMOND TREES

The existing almond trees on the site sequester carbon from the air and store it within the tree system. Removal of the trees will result in the site losing the ability to store carbon from the existing trees. The average amount of carbon stored per year per tree will be calculated through USDA's i-Tree carbon sequestration tool. Carbon sequestration rates for the existing trees will be based on the average tree diameter of an almond tree. The analysis will estimate the loss of stored carbon based on the number of trees that would be removed as a result of Project construction.

4.3.2 NEW PROJECT TREES

The Project will also plant approximately 535 trees across the Project site. As such, the i-Tree software will also be utilized to account for the carbon reduction from these trees. Carbon sequestration rates will be based on a California shade tree species from Chapter 5 of the IPC2 Specific Plan with an average tree diameter of 12 inches.

4.3.3 CONCLUSIONS

The modeling presented above represents the worst-case scenario for Project buildout based on the information available at the time of preparation. This modeling may be refined as additional Project details come forward. Additionally, this modeling memo does not account for any mitigation. Following preliminary modeling, additional modeling will be prepared that accounts for Project mitigation to reduce emissions.

Reference: Health Risk Analysis Methodology Memorandum

The Health Risk Analysis (HRA) Methodology Memorandum (Memo) was prepared to summarize the methodology that Stantec will use to estimate the health risks posed to nearby sensitive receptors during construction and operation of the International Park of Commerce (IPC), Phase 2 (Project). This Memo is being prepared based on the San Joaquin Valley Air Pollution Control District's (SJVAPCD) May 1, 2023 comments asking to review the HRA methodology.

1 Project Description

The Project proposes to construct 5.36 million square feet of warehousing and industrial development as well as a water and wastewater treatment plant, parking, landscaping, and roadways. The Project would be constructed in three phases. In general, Phase 1 would construct the utilities including the fire system, water, and wastewater treatment systems. Phase 2 would construct Industrial Buildings 1 through 3 as well as their associated parking, infrastructure expansion, and roadways. Phase 3 would construct Buildings 4 and 5 as well as their associated parking, infrastructure expansion, and roadways. Phases 1-2 will overlap to construct the northern portion of the Project site. Phase 3 will develop the southern portion of the Project site and is anticipated to begin construction as Phase 1 and Phase 2 become fully operational. The air quality analysis will include an evaluation of the Project's construction emissions, operational emissions, and emissions from the overlap of Phase 1-2 operation and Phase 3 construction.

2 Proposed Methodology

In order to estimate the risks posed to sensitive receptors over the course of Project construction and operation, five HRA scenarios are proposed. These scenarios include:

- **Scenario 1:** Construction HRA (10 year exposure period);
- **Scenario 2:** Full Project Buildout (70 year exposure period);
- **Scenario 3:** Overlapping Risks (70 year exposure period);

- **Scenario 4:** Existing Conditions HRA (70 year exposure period); and
- **Scenario 5:** Future, without Project (70 year exposure period).

The Project site lies within the SJVAPCD and, as such, the modeling will be consistent with the SJVAPCD's Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI) and the Office of Environmental Health Hazard Assessment's (OEHHA) 2015 Risk Guidelines. During construction and operation, the main source of toxic air contaminant (TAC) emissions would be diesel particulate matter (DPM) from off-road construction equipment and heavy duty trucks. DPM emissions will be calculated using the California Emissions Estimator Model (CalEEMod) and the California Air Resources Board's (CARB) EMFAC2021 emission factors. PM_{10} exhaust will serve as a proxy for DPM for this analysis.

Under each scenario, the United States Environmental Protection Agency (USEPA) AERMOD steady-state air dispersion model will be used to estimate the concentration of DPM at nearby receptors. For the analysis, meteorological data from Tracy Station (Station ID 99008) will be used.[1] The latest available data from the Tracy Station is from 2004 to 2008.

The nearest sensitive receptor is a single family residence located approximately 615 feet east of the site. Other single family residences near the site or near the anticipated trucking routes lie within the City of Tracy and in the unincorporated communities of Lammers and Mountain House. In addition, the site lies near the following schools:

- John C. Kimball High School, approximately 2,760 feet northeast of the Project site;
- George Kelly Elementary School, approximately 4,900 feet east of the Project site;
- Freiler Elementary School, approximately 1.76 miles northeast of the Project site; and
- Lammers Elementary School, approximately 1.90 miles northwest of the Project site.

Receptors included within AERMOD are depicted as red points in Figure 1.

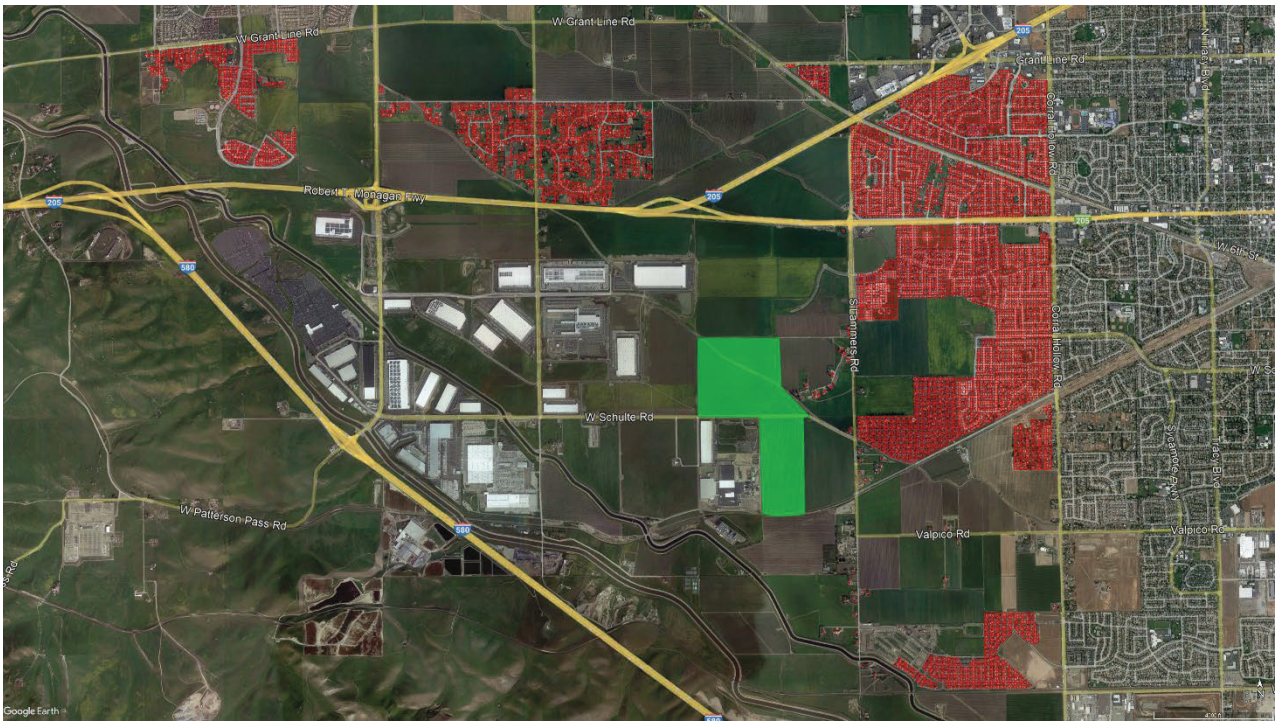
Figure 1. Project Site and Sensitive Receptor Locations



2.1 Scenario 1: Construction HRA

The construction HRA will evaluate the health risk posed from off-road construction equipment and on-road diesel trucks. Construction of the Project is anticipated to take place in three phases over a period of 10 years and will include site preparation, grading, building construction, paving, and architectural coating activities.

The average emission rate of DPM across the construction phases will be applied in two separate AERMOD models. Phase 1 and Phase 2 will be modeled as an area-polygon source with emissions generated uniformly across the northern portion of the site while Phase 3 will be modeled as an area-polygon source on the southern portion of the site.

The concentration derived from AERMOD at the maximally exposed individual receptor (MEIR) and maximally exposed individual school receptor (MEISR) will be used to calculate the cancer and non-cancer health risks using OEHHA's most recent guidance which requires the cancer risk to be calculated with age factors that account for the higher risk posed to infants and children. The cancer risks during Phases 1-2, Phase 3, and total construction risk will either be calculated with OEHHA-provided risk calculations or within the CARB Risk Assessment Standalone Tool (RAST) starting at the third trimester through the first ten years of life for the MEIR. The MEISR will be calculated for the duration of student exposure. For example, in the event that the MEISR is located at John C. Kimball High School, exposure will be calculated for a period of four years.

2.2 Scenario 2: Full Project Buildout

Scenario 2 will evaluate the risk posed to sensitive receptors during full Project operation over a 70-year period. The risk is assumed to begin during the first year of full operation (2036). The onsite emissions from any diesel equipment (i.e., forklifts, tractors) will be modeled as an area-polygon source across the entire site. Vehicle emissions will be modeled as line volume sources on the proposed trucking routes. The DPM generated from heavy duty trucks will be split based on the frequency of travel by route. The traffic and routing information will be provided by Fehr and Peers who is preparing the Traffic Impact Assessment (TIA) for the Project. The vehicle emissions will be calculated for each year of Project operation through CARB's EMFAC to account for the reductions in fleet emissions from state and federal regulations. EMFAC only estimates emissions through 2050. Years of operation after 2050 will rely on the last year of available data, which will result in a conservative estimate of the Project's long-term health risks.

The cancer risks during full buildout will either be calculated with OEHHA-provided risk calculations or within the CARB RAST starting at the third trimester of life through age 70 for the MEIR. The risk will also be calculated for the MEISR based on the worst case scenario.

2.3 Scenario 3: Overlapping Risks

This scenario will calculate the risk posed to sensitive receptors during Project construction and operation, including the overlap in emissions from Phases 1-2 operation and Phase 3 construction. The modeling for Phases 1-2 construction in Scenario 1 and full Project buildout under Scenario 2 will also be used in this analysis. In addition, an AERMOD model will be prepared to assess the concentration at the MEIR during Phases 1-2 of operation. For the Phases 1-2 operational scenario, all on-site sources of emissions will be modeled as an area-polygon source on the northern end of the Project site and all on-road emissions will be modeled as line volume sources. The amount of traffic and associated emissions on each roadway will be based on the percentage of buildout under Phases 1-2 and the TIA.

The cancer risk posed to the MEIR during these overlapping risks will either be calculated with OEHHA-provided risk calculations or within the CARB RAST. The worst-case age breakdown of the MEIR during the different phases of construction and operation are provided in Table 1. The risk will also be calculated for the MEISR based on the worst case scenario.

Table 1: MEIR Exposure Periods under Scenario 3

Exposure Scenario	Duration (Years)	Receptor Ages
Phases 1-2 Construction	5	Third Trimester (0.25 years); Infant (0-2 years); Child (3-5 years)
Phases 1-2 Operation and Phase 3 Construction	5	Child (6-11 years)
Full Project Buildout	60	Child (12-16 years); Adult (16-70 years)

2.4 Scenario 4: Existing Conditions

Under this scenario, the HRA will evaluate the risks posed to sensitive receptors over a 70-year period under existing conditions (2023). The existing Project site serves as an almond orchard. The air modeling will include a baseline analysis of the existing site based on assumptions for the annual workers and truck trips to the site as well as annual harvesting emissions.

The cancer risks under existing conditions will either be calculated with OEHHA-provided risk calculations or within the CARB RAST starting at the third trimester of life through age 70. The existing risk will also be calculated for the MEISR based on the worst case scenario.

2.5 Scenario 5: Future, without Project

Under this scenario, a quantitative cancer risk would be prepared over a 70-year period beginning in the buildout year of the Project (2036) to determine the risks posed to nearby residential receptors under the future conditions without implementation of the Project based on traffic data provided within the TIA.

The cancer risks assuming future conditions without Project will either be calculated with OEHHA-provided risk calculations or within CARB RAST starting at the third trimester of life through age 70. The risk will also be calculated for the MEISR based on the worst case scenario.

3 Conclusions

The modeling scenarios presented above demonstrate the full breadth of health risks posed to receptors around the site during Project construction, operation, and baseline scenarios. The health risk scenarios were derived based on similar projects across the state and comments from SJVAPCD and CARB on the Project's Initial Study/Notice of Preparation of a Draft EIR.

Hello Ms. Heck,

The District reviewed the Health Risk Assessment Methodology Memorandum and Air Quality and Greenhouse Gas Modeling Assumptions Memorandum. The District offers the following comments:

1. **Health Risk Assessment (HRA) Methodology Memo**
    a. The HRA methodology states that assessments will be prepared for the existing agricultural operation and the proposed industrial commerce center. If a comparison is made between the existing and proposed project health risks, then the District recommends that risk be calculated on a receptor by receptor basis and the health risk from the receptor with the highest increase in risk is compared to the District's CEQA significance risk thresholds.

2. **Air Quality and Greenhouse Gas Modeling Assumptions Memo**
    a. Please include an assumption for the trip length distance for off-site Heavy-Heavy Duty (HHD) truck travel. The environmental review should adequately characterize and justify an appropriate trip length distance for off-site HHD truck travel to and from the Project site since the Project consists of a warehouse/distribution center that is expected to generate a high volume of HHD truck trips, and those trucks generally travel further distances for distribution.

    b. The District does not have any authority over greenhouse gases, therefore, the District did not review the greenhouse gas discussion.

    c. In case subsequent project analysis/assumptions include compliance with District rules and regulation, for example Rule 9510 Indirect Source Review: the project is subject to District Rule 9510 Indirect Source Review for which an Air Impact Assessment (AIA) application is required to be submitted no later than applying for project-level approval from a public agency.

    d. The District understands this Memo is in regards to the Methodology to perform an Air Quality Analysis, should mitigation measures be included for the project, those would need to be incorporated into the analysis/environmental review. A few examples but not limited to, that would apply to this project would be reducing truck idling, assessing truck routing, using near-zero or zero emission trucks, installing electric vehicle and electric truck infrastructure, electric on-site off-road and on-road equipment, implementation a Voluntary Emission Reduction Agreement, etc.

Please let myself or Michael Corder know if you have any questions.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22.3	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22.3	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22.3	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	43.0
Healthy Places Index Score for Project Location (b)	72.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22.3	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22	annual days of extreme heat

Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22.3	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22.3	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22.3	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

Emissions are calculated for base and future years using Equation 1.

Emissions=Population*Activity*Hp*LF*EF* FCF (Equation 1)

Where:

Population =	Count of equipment population
Activity =	Time the engine is running (hours)
Hp =	Horsepower (max brake horsepower) of the engine
LF =	Load factor (unit-less)
EF =	Emission factor (grams/kW-hr) specific to horsepower and model year and pollutant, and includes deterioration
FCF =	Fuel correction factor (unit-less) based on calendar year

If this equiation was used to calculate the emissions provided above, the we can determine the emission rate per piece of equipment per hour.

VMT

Heavy and medium truck trips would be 41.8 miles in length. Auto trips from employee commutes would be 25.29 miles in length.
To apply this in CalEEMod, we defined "Non Res H-W" trip types as auto trips, and "Non Res W-O" trip types as medium and heavy trucks.
Under "Rates and Lengths", a the trip lengths were defined
Under "Purpose and Percentages", the trip types were defined.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	22	annual days of extreme heat
Extreme Precipitation	0.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.3	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.
